ONE THING

PRODUCT DESCRIPTION | EXCLUSIVE ACQUISITION

Acquisition overview

One Thing is a minimalist Android focus and productivity application built around a simple workflow: choose one task, commit to a block of time, and complete the session. Its product message is **“One Task. One Block of Time.”**

The application is currently a functional, pre-revenue product. It has been personally tested by its developer, but it has not been publicly launched on Google Play and has no established customer base, download history or revenue.

Core features

Area	Included functionality
Task and session setup	Custom task entry; adjustable focus duration from 1 to 90 minutes; 15, 25, 45 and 90-minute presets.
Focus experience	Live countdown and progress; background focus sessions; completion notification/alarm.
Distraction tracking	Slip/distraction tracking during a focus session.
Progress and history	Session history (last 30 sessions); weekly productivity summary; daily streak tracking.
Additional experience	Motivational quotes and a simple, single-task-oriented interface.

Technology and delivery

Native Android application. The project uses Kotlin and XML layouts, with local persistence through SharedPreferences/JSON. The configured package identifier is **com.pratik.onething**; the project configuration specifies minimum Android API 24 and target API 34. No backend or external API is required for the documented core functionality.

Proposed exclusive acquisition

The developer is offering the complete product for acquisition by one buyer. The proposed package may include the Android project source, release APK, product assets, available documentation and an agreed transfer of intellectual property rights. The exact deliverables, exclusions, payment milestones and transfer date must be written into a signed agreement.

Commercial status and limitations

This is a pre-revenue software asset, not an operating business with proven traction. No claims are made about active users, revenue, retention, market share or commercial performance. No Google Play listing or public distribution history is currently established.

The project has not been represented as independently audited or covered by a comprehensive automated test suite. A buyer should review the source, build process, dependencies, permissions, device compatibility and known

issues before completing an acquisition.
